# State-dependent pass-through from monetary policy to lending rates

Federico Puglisi

Bank of Italy and Northwestern University

2024 Annual Meeting Society for Economic Dynamics, Barcelona, June 6, 2024

The views expressed in this presentation and in the related paper are those of the author and do not necessarily reflect the views of the Bank of Italy or the Eurosystem.

• The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.
- The distribution of lending rates exhibits high dispersion even conditional on borrower/product characteristics. .

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.
- The distribution of lending rates exhibits high dispersion even conditional on borrower/product characteristics. ⇒ Pronounced Skewness.

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.
- The distribution of lending rates exhibits high dispersion even conditional on borrower/product characteristics. ⇒ Pronounced Skewness.
- The lending rates dispersion (Skewness) varies considerably over time and space.

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.
- The distribution of lending rates exhibits high dispersion even conditional on borrower/product characteristics. ⇒ Pronounced Skewness.
- The lending rates dispersion (Skewness) varies considerably over time and space.
- > What is the connection between the two?

- The extent to which changes in the Monetary Policy (MP) rate pass-through to lending rates is a key determinant of MP efficacy.
- The pass-through of monetary policy to lending rates varies considerably over time and space.
- The distribution of lending rates exhibits high dispersion even conditional on borrower/product characteristics. ⇒ Pronounced Skewness.
- The lending rates dispersion (Skewness) varies considerably over time and space.
- > What is the connection between the two?
- Understanding the source of pass-through heterogeneity is crucial to assess the real effects of MP on the macroeconomy.

Q: Is lending rates dispersion a relevant state-variable for Monetary Policy (MP)?

Skewness vs Variance?

• Use county-level dispersion in offered rates by branch and loan product.

Q: Is lending rates dispersion a relevant state-variable for Monetary Policy (MP)?

Skewness vs Variance?

- Use county-level dispersion in offered rates by branch and loan product.
- Key Result 1: Higher  $\underline{initial\ skewness} \Rightarrow stronger\ MP\ pass-through\ to\ lending\ rates$

Q: Is lending rates dispersion a relevant state-variable for Monetary Policy (MP)? Skewness vs Variance?

- Use county-level dispersion in offered rates by branch and loan product.
- $\bullet \ \ \textbf{Key Result 1:} \ \ \, \textbf{Higher} \ \, \underline{\textbf{initial skewness}} \Rightarrow \textbf{stronger} \ \, \underline{\textbf{MP pass-through to lending rates}} \\$
- $\bullet \ \ \textbf{Key Result 2:} \ \ \text{Higher } \underline{\text{initial skewness}} \Rightarrow \mathsf{larger} \ \underline{\mathsf{MP}} \ \mathsf{efficacy} \ \mathsf{on} \ \mathsf{real} \ \mathsf{economy}$

Q: Is lending rates dispersion a relevant state-variable for Monetary Policy (MP)?

Skewness vs Variance?

- Use county-level dispersion in offered rates by branch and loan product.
- Key Result 1: Higher  $\underline{initial\ skewness} \Rightarrow stronger\ MP\ pass-through\ to\ lending\ rates$
- Key Result 2: Higher  $\underline{\text{initial skewness}} \Rightarrow \text{larger } \underline{\text{MP efficacy on real economy}}$
- Key Result 3: Skewness is relevant dimension of dispersion rather than Variance.

# Q: Is lending rates dispersion a relevant state-variable for Monetary Policy (MP)? Skewness vs Variance?

- Use county-level dispersion in offered rates by branch and loan product.
- Key Result 1: Higher initial skewness ⇒ stronger MP pass-through to lending rates
- Key Result 2: Higher  $\underline{initial\ skewness} \Rightarrow larger\ \underline{MP\ efficacy\ on\ real\ economy}$
- Key Result 3: Skewness is relevant dimension of dispersion rather than Variance.
- HOW: Local Projections & detailed micro-data on lending
  - **High-Frequency Proxy** identification of exogenous variation in MP rate changes.
  - Panel Local projections with interaction terms
  - Branch/product-level lending rates on new loans.

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction

Price Dispersion (absent any shock)

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction
- Customers' search friction (Incomplete Information:  $I_t = r_{t-1}^i$ )

Price Dispersion (absent any shock)

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction
- Customers' search friction (Incomplete Information:  $I_t = r_{t-1}^i$ )

1 MP shocks shift lenders' funding costs.

Price Dispersion (absent any shock)

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction

Price Dispersion (absent any shock)

• Customers' search friction (Incomplete Information:  $I_t = r_{t-1}^i$ )

- 1 MP shocks shift lenders' funding costs.
- 2 Higher initial Skewness ⇒ Larger borrowers' incentives to search for rates today.

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction
- Customers' search friction (Incomplete Information:  $I_t = r_{t-1}^i$ )

Price Dispersion (absent any shock)

- 1 MP shocks shift lenders' funding costs.
- 2 Higher initial Skewness ⇒ Larger borrowers' incentives to search for rates today.
- 3 Lenders' larger potential for capturing borrowers from competition.

Q: How can we explain my empirical findings?

A: Theoretical model of lender imperfect competition

- Bertrand competition
- Customers' switching friction
- Customers' search friction (Incomplete Information:  $I_t = r_{t-1}^i$ )

Price Dispersion (absent any shock)

- 1 MP shocks shift lenders' funding costs.
- 2 Higher initial Skewness  $\Rightarrow$  Larger borrowers' incentives to search for rates today.
- 3 Lenders' larger potential for capturing borrowers from competition.
- 4 Stronger lenders' price complementarity  $\Rightarrow$  larger MP pass-through.

- 5 Conclusions

#### Core Micro-Data

### Branch-Level Offered Base Loan Interest Rates from S&P GMI Ratewatch (New to the literature):

- 30+ Loan Products (House, Consumer Durables, Small Business Loans, Commercial RE).
- Time Span: 2001-2019. Monthly frequency.
- 100,000+ branches (brick-and-mortar offices, cyber offices,...).
- 7500 financial institutions (banks, credit unions, S&L, brokers...).

#### Core Micro-Data

#### Branch-Level Offered Base Loan Interest Rates from S&P GMI Ratewatch (New to the literature):

- 30+ Loan Products (House, Consumer Durables, Small Business Loans, Commercial RE).
- Time Span: 2001-2019. Monthly frequency.
- 100,000+ branches (brick-and-mortar offices, cyber offices,...).
- 7500 financial institutions (banks, credit unions, S&L, brokers...).
- Loan product characteristics.
- Branch location, ownership & rate-setting rights.

#### Other Data

#### 1 Macro Indicators:

- National/State-level: GDP, Prices, Excess Bond Premium, House Prices.
- County-Level: Unemployment, Wages, House Prices (Zillow).

#### Other Data

#### 1 Macro Indicators:

- National/State-level: GDP, Prices, Excess Bond Premium, House Prices.
- County-Level: Unemployment, Wages, House Prices (Zillow).

#### 2 Lender Data:

- Lender-level: Asset, Liability, Interest Income/Expense by category.
- Branch-level: Location, period of activity, ownership, tot. deposit volume.

#### Other Data

#### 1 Macro Indicators:

- National/State-level: GDP, Prices, Excess Bond Premium, House Prices.
- County-Level: Unemployment, Wages, House Prices (Zillow).

#### 2 Lender Data:

- Lender-level: Asset, Liability, Interest Income/Expense by category.
- Branch-level: Location, period of activity, ownership, tot. deposit volume.

#### 3 Robustness Loan-Level Data:

- Freddie-Mac Data on Mortgage Loans.
- Loan Characteristics, Borrower Characteristics, Renegotiation/Cashout Status.

# Local projection specification

**Methodology:** Local projections. county(c)/product(p)/month(m) panel.

Outcome Variable 
$$_{t+h,c,m} = \alpha + \frac{\beta_0}{\rho_0} \mathsf{MP}_t + \underline{\beta_1} \left[ \mathsf{MP}_t \times \widehat{\mathsf{Skewness}}_{t-1,c} \right] + \sum_{k=0}^2 \beta_{3,k} \widehat{\mathsf{Skewness}}_{t-k-1,c} + \sum_{k=1}^2 \rho_{1,k} \mathsf{MP}_{t-k} + \sum_{k=1}^2 \rho_{2,k} \left[ \mathsf{MP}_{t-k} \times \widehat{\mathsf{Skewness}}_{t-k-1,c} \right] + \sum_{k=1}^2 \gamma_k X_{t-k,c,m} + \sum_{k=1}^2 \delta_k X_{t-k,US} + \sum_{k=1}^2 \chi_k X_{t-k,lender} + \varepsilon_{t,c,m}$$

Outcome Variables: County/Product Average Lending Rate, County Unemployment Rate.

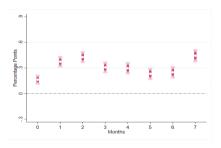

Controls: National GDP, Defl, Stock Market, Excess Bond Premium, county: wage growth, unemployment, home prices, Herfindal Index, ROA, Cost of Funds, Loan Loss Provisions, lags of the outcome variable, Product/County FE.

Identification: High Frequency Proxy from Bauer and Swanson (2022).

Note: Skewness defines the county-level skewness subtracted of its long-run mean.

# Coefficient Plots: Lending Rates

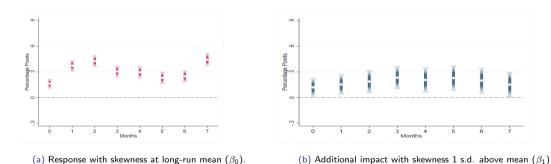

Average response of county lending rates to 100 b.p. MP shock

- (a) Response with skewness at long-run mean  $(\beta_0)$ .
- Result 1: Pass-Through significantly higher when ex-ante skewness is high.

# Coefficient Plots: Lending Rates

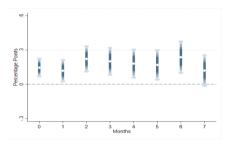

# Average response of county lending rates to 100 b.p. MP shock

• Result 1: Pass-Through significantly higher when ex-ante skewness is high.

# Robust Specification: Lending Rates

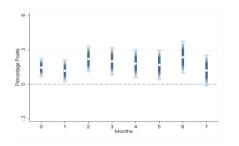

Average response of county average lending rates to 100 b.p. MP shock, robust specification

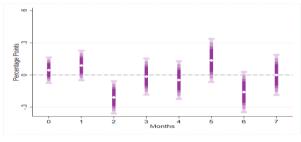

- (b) Additional impact: skewness 1 s.d. above mean  $(\beta_1)$ 
  - Result 2: Skewness remains highly significant. Variance is NOT significant.

# Robust Specification: Lending Rates

Average response of county average lending rates to 100 b.p. MP shock, robust specification

(b) Additional impact: skewness 1 s.d. above mean  $(\beta_1)$ 

- (c) Additional impact: variance 1 s.d. above mean  $(\beta_3)$
- Result 2: Skewness remains highly significant. Variance is NOT significant.
- Result 3: Higher ex-ante Skewness higher MP effects on Unemployment

#### Robustness

- Variance vs Skewness.
- Increased Set of Interaction Terms.
- Different High-Frequency Proxy.
- Average Interest Rate Expense.
- Robustness with Respect to US pooled Skewness.
- Real Personal Income (State/Lender Level Data).
- Loan-Level Data on Realized Rates.

• Lending rate skewness is a quantitatively important state-variable for MP effects.

- Lending rate skewness is a quantitatively important state-variable for MP effects.
- 1 s.d. ↑ skewness roughly increases MP pass-through by 75%, and efficacy by 25 %.

- Lending rate skewness is a quantitatively important state-variable for MP effects.
- 1 s.d. ↑ skewness roughly increases MP pass-through by 75%, and efficacy by 25 %.
- $\bullet$  Can account for heterogeneity across space and  $\underline{time}$  of MP effects.

- Lending rate skewness is a quantitatively important state-variable for MP effects.
- 1 s.d. ↑ skewness roughly increases MP pass-through by 75%, and efficacy by 25 %.
- Can account for **heterogeneity** across **space** and **time** of MP effects.
- Search & Switching Frictions to MP.

### THANKS!

- Lending rate skewness is a quantitatively important state-variable for MP effects.
- 1 s.d.  $\uparrow$  skewness roughly increases MP pass-through by 75%, and efficacy by 25 %.
- Can account for **heterogeneity** across **space** and **time** of MP effects.
- Search & Switching Frictions to MP.
- Future work:
  - 1 Include data on loan applications to measure search efforts empirically.
  - 2 Extend analysis to deposit rates.
  - 3 Explore GE outcomes in general dynamic macro model.

### THANKS!

## **APPENDIX**

# **APPENDIX**

#### Literature Review

#### State-Dependence of Monetary Policy

- Mortgage Refinancing/Prepayment channel. Berger et al. (2021), Eichenbaum et al. (2022).
- ⇒ Explore state-dependence arising from bank's strategic pricing and customer search & switching frictions.

#### Monetary Policy Transmission through Banks

- Long stream: banks' regulatory and asymmetric information constraints. Bernanke and Blinder (1988), Kashyap and Stein (2000).
- Recent stream: banks' market power in liquidity provision. Nagel (2016), Drechsler et al. (2017), Wang et al. (2020).
- ⇒ Expand to role of bank imperfect competition and consumer frictions.

### IO literature on Customer Search and Switching costs.

- Yankov (2018), Luco (2019), Andersen et al. (2020)
- $\Rightarrow$  Expand on the role of search & switching costs on interest-setting.

### Outline

- 4 Empirical Analysis
- **5 Theoretical Framework**
- 6 Conclusions

### Data: Macro at all levels.

### 1 National - Level:

 GDP, CPI Index, Commodity Price Index, Excess Bond Premium, Home Price Index, Home Ownership Indexes.

#### 2 State - Level:

- GDP (total and by Industry), Personal Income,
- Inflation (Hazell et al. (2020))
- State Home Price Index.

### 3 County/MSA - Level :

- Unemployment (BLS-LAUS)
- Wages (BLS-QCEW & CES)
- House Prices (Zillow)

## Data: Lending at all levels

- 4 Lender level (Call Reports):
  - Assets and liabilities.
  - Interest revenue and expense by Asset & Liability category.
- 5 Other: Branch level (FDIC Summary of Deposits):
  - Location, dates of activity, ownership.
  - Total deposits by year.
- 6 Other: Loan level (Freddie-Mac Data):
  - Loan characteristics. (Location, LTV)
  - New/Renegotiation/Cash-out status.
  - Borrower characteristics. (FICO)

⇒ MSA with High Mortage Rate Skewness stronger response in Refinancing rates.

#### Loan/MSA-Level Data: Freddie Mac House Mortgage Loans

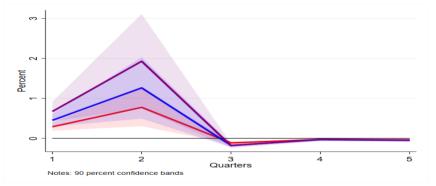

Methodology: IV Local Projections with High Frequency Proxy.

$$\begin{aligned} & \text{Refinancing Rates}_{t+h,s} & = & \alpha + \underline{\beta_0 \operatorname{Treasury Rate}}_t + \underline{\beta_1} \left[ \underline{\operatorname{Treasury Rate}}_t \times \underline{\operatorname{Skewness}}_{t,s} \right] + \\ & + & \underline{\beta_2} \left[ \underline{\operatorname{Treasury Rate}}_t \times \underline{\operatorname{Rate Gap}}_{t,s} \right] + \\ & + & \sum_{k=1}^2 \rho_{1,k} \operatorname{Treasury Rate}_{t-k} + \sum_{k=1}^2 \rho_{2,k} \left[ \operatorname{Treasury Rate}_{t-k} \times \underline{\operatorname{Skewness}}_{t-k,s} \right] + \\ & + & \sum_{k=1}^2 \gamma_k X_{s,t-k} + \sum_{k=1}^2 \delta_k X_{US,t-k} + \varepsilon_{s,t} \end{aligned}$$

Controls: CPI, GDP, Unemployment, Home Equity, Bank Herfindal Index, LTV, Age/Maturity, FE.

#### Loan/MSA-Level Data: Freddie Mac House Mortgage Loans

#### Impulse Response of refinancing rates to MP with Refinancing and Bank Moment Channels

Impulse responses to 50bp exogenous decrease in 30Y Mortgage Rate. Red line: pure shock. Blue Line: Refinancing Channel is active. Purple Line: bank moment channel is active. SE clustered at the county level.

Model Appendix: (Very Simple framework, Graphical Intuitions and Model Details)

	Bank	Borrower			
Type A Type B	high market power low market power	high switching cost $\phi$			

#### Borrower's Choice

$$\min \mathbf{e}(r) = egin{cases} r_{t-1,A}, & ext{if old loan product} \\ r_{t,A} + \psi, & ext{if new loan product} \\ r_{t,B} + \phi_A & ext{if switch bank B} \end{cases}$$

#### Bank's problem:

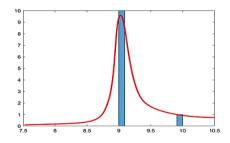

$$\begin{aligned} \max_{r_{t,A},S} \quad & \pi = [r_{t,A} - c] \, \mathbf{1}_{S = \mathsf{Lend}} \\ \text{(IC1)} \quad & r_{t,A} \leq r_{t,B} + \phi_A \qquad \text{if } r_{t,A} = r_{t-1,A} \\ \text{(IC2)} \quad & r_{t,A} + \psi \leq r_{t,B} + \phi_A \quad \text{if } r_{t,A} \neq r_{t-1,A} \end{aligned}$$

#### Assume:

- $r_{t,b} = c$
- $c = r_{FED}$
- n-x banks type B, x type A

#### **Starting Point:**

$$r_{t,B} = r_{t,FED} = c = 9\%$$
  
 $r_{t,A} = 10\%$ 

Quarter 1: Bank Rates Distribution

#### One quarter later FED easens by 0.5%:

$$r_{t,B} = c = 8.5\%$$

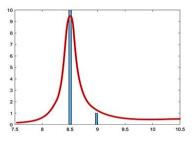

#### Assume:

$$1 \ \phi_{A} = 1\%$$

$$2 \ \psi_{A} = 0.5\%$$

$$r_{t,A} = 9\%$$

Pass-Through: 
$$\frac{(n-x)*(9\%-8.5\%)+x*(10\%-9\%)}{0.5\%}>1$$

Quarter 2: Bank Rates Distribution

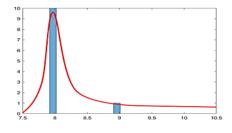

#### One quarter later FED easens again by 0.5%:

$$r_{t,B} = c = 8\%$$

$$r_{t,A} = r_{t-1,A} = 9\%$$

Pass-Through: 
$$\frac{(n-x)*(8.5\%-8\%)+x*(9\%-9\%)}{0.5\%} < 1$$

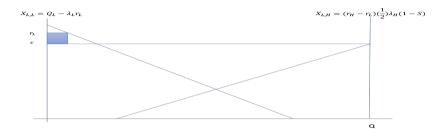

Quarter 3: Bank Rates Distribution

- Competition among banks with local market power gives rise cross-sectional differences among banks
- Higher order moments can act as a state for MP efficacy.

# Graphic Intuition, Strategic L fixed H

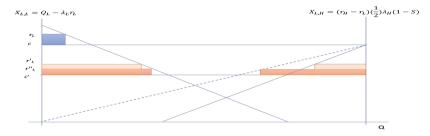

Low skewness.

▶ back

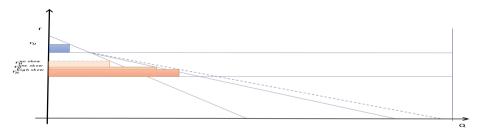

Lower skewness. MP easing.

Higher skewness. Same MP easing.

No/Low/High Skewness. MP Easing.

#### Best Responses:

Best Responses for Duopoly with Bank H:

Bank H:

$$r_{H} = \frac{\left[\bar{Q}_{H} + \kappa r_{L} + \beta_{H} c\right]}{2\beta_{H}}$$

Bank L:

$$r_{L} = \frac{\left[\bar{Q}_{L} + \kappa r_{H} + \beta_{L} c\right]}{2\beta_{L}}$$

Substituting  $r_H$  into  $r_L$ : Bank L:

$$\begin{split} r_L &= \left[\frac{\bar{Q}_L}{2\beta_L} + \frac{\bar{Q}_H}{4\beta_H\beta_L}\right] + \left[\frac{\kappa^2}{4\beta_H\beta_L}\right] r_L + \left[\frac{\kappa\beta_H}{4\beta_H\beta_L} + \frac{1}{2}\right] c \\ \\ \frac{\partial r_L}{\partial c} &= \left[\frac{4\beta_H\beta_L}{4\beta_H\beta_L - \kappa^2}\right] \left[\frac{\kappa\beta_H + 2\beta_H\beta_L}{4\beta_H\beta_L} + \frac{1}{2}\right] = \left[\frac{\kappa\beta_H + 2\beta_H\beta_L}{4\beta_H\beta_L - \kappa^2}\right] \end{split}$$

#### Proposition 2

$$rac{\partial r_i^*}{\partial c}$$
 is increasing in  $\left(r_{t-1}^H - r_{t-1}^L
ight)$  and  $\lambda_1$ .

**Intuition:** Larger difference among past rates  $\Rightarrow$  More clients search.

#### Proposition 2

$$rac{\partial r_i^*}{\partial c}$$
 is increasing in  $\left(r_{t-1}^H - r_{t-1}^L
ight)$  and  $\lambda_1$ .

**Intuition:** Larger difference among past rates ⇒ More clients search. Larger initial mass of Bank H clients ⇒ More clients search.

#### Proposition 2

$$\frac{\partial r_i^*}{\partial c}$$
 is increasing in  $\left(r_{t-1}^H - r_{t-1}^L\right)$  and  $\lambda_1$ .

**Intuition:** Larger difference among past rates  $\Rightarrow$  More clients search.

Larger initial mass of Bank H clients  $\Rightarrow$  More clients search.

More clients on the search  $\Rightarrow$  higher pass-through.

#### Proposition 2

$$rac{\partial r_{t}^{*}}{\partial c}$$
 is increasing in  $\left(r_{t-1}^{H}-r_{t-1}^{L}
ight)$  and  $\lambda_{1}$ .

**Intuition:** Larger difference among past rates  $\Rightarrow$  More clients search.

Larger initial mass of Bank H clients  $\Rightarrow$  More clients search.

More clients on the search  $\Rightarrow$  higher pass-through.

**Note:** Skewness increases in  $(r_{t-1}^H - r_{t-1}^L)$  and  $\lambda_1$ .

#### Proposition 2

$$rac{\partial r_{t}^{*}}{\partial c}$$
 is increasing in  $\left(r_{t-1}^{H}-r_{t-1}^{L}
ight)$  and  $\lambda_{1}$ .

**Intuition:** Larger difference among past rates  $\Rightarrow$  More clients search.

Larger initial mass of Bank H clients ⇒ More clients search.

More clients on the search  $\Rightarrow$  higher pass-through.

**Note:** Skewness increases in  $(r_{t-1}^H - r_{t-1}^L)$  and  $\lambda_1$ .

**Take-Away:** Larger Skewness  $\Rightarrow$  more clients on the search  $\Rightarrow$  higher pass-through.

## Proposition 3

$$\frac{\partial r_H^*}{\partial c} > \frac{\partial r_L^*}{\partial c}^1$$

Intuition: L faces only "upside-risk" of acquiring clients from Bank H.

➤ Variance vs Skewness → back

 $<sup>^1</sup>$  Technical Condition  $\lambda_2 > \lambda_1 \mathcal{S}$ 

#### Proposition 3

$$\frac{\partial r_H^*}{\partial c} > \frac{\partial r_L^*}{\partial c}^1$$

**Intuition:** L faces only "upside-risk" of acquiring clients from Bank H. Bank H faces "downside-risk" of losing clients to Bank L.

► Variance vs Skewness ► b

<sup>&</sup>lt;sup>1</sup> Technical Condition  $\lambda_2 > \lambda_1 S$ 

### Proposition 3

$$\frac{\partial r_H^*}{\partial c} > \frac{\partial r_L^*}{\partial c}^1$$

**Intuition:** L faces only "upside-risk" of acquiring clients from Bank H. Bank H faces "downside-risk" of losing clients to Bank L.

Take-Away Bank H responds by more than Bank L to MP.

▶ Variance vs Skewness

<sup>&</sup>lt;sup>1</sup> Technical Condition  $\lambda_2 > \lambda_1 S$ 

#### Proposition 3

$$\frac{\partial r_H^*}{\partial c} > \frac{\partial r_L^*}{\partial c}^{1}$$

 $\textbf{Intuition:} \ L \ \text{faces only "upside-risk" of acquiring clients from Bank H}.$ 

Bank H faces "downside-risk" of losing clients to Bank L.

Take-Away Bank H responds by more than Bank L to MP.

#### Implications:

- 1 Empirical Test of Proposition 3. (next slide)
- 2 Path Dependence of Monetary Policy.

<sup>&</sup>lt;sup>1</sup> Technical Condition  $\lambda_2 > \lambda_1 S$ 

#### Empirical Test of Proposition 3

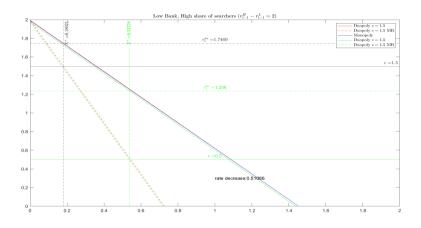

Table: Responsiveness of High vs Low Rate lender to a 100 b.p. monetary policy shock when skewness is high

Initial Skewness vs Pass-Through

#### Model Simulation: Variance vs Skewness

Example: 2 parameters draws, different pass-through, different initial skewness, same initial variance.

#### Consumer Problem: stage 0 to 3

- Consider the case  $r_{t-1}^A > r_{t-1}^B$  then:
- For each z only consumers with  $\theta$ :  $v \mathbb{E}[r_t^A z] \ge v \mathbb{E}[r_t^B (2 z) \theta]$  will stay Type 1.
- Hence  $v r_{t-1}^A 1 \ge v r_{t-1}^B 1 \theta \leftrightarrow \theta \ge [r_{t-1}^A r_{t-1}^B]$
- Finally for each z  $\int_0^{\bar{\theta}} \frac{1}{\bar{\theta}} \mathbb{1}_{\{\theta>gap_{t-1}\}} = \left[\frac{\bar{\theta}-gap_{t-1}}{\bar{\theta}}\right] = P(gap_{t-1})$
- After z is realized the number of type 1 consumers for each z will be P.
- Once c is realized banks chose  $r_t$ . The final demand of type 1 to Bank A will hence be:

$$egin{array}{lcl} X_A^1(r_t^A) & = & \int_0^2 \lambda_1 \int_0^{ar{ heta}} & rac{1}{ar{ heta}} \mathbb{1}_{\{v-z-r_t^A>0| \ ext{Type 1 choice}\}} \mathbb{1}_{\{ heta>gap_{t-1}\}} d heta dz \\ & = & \lambda_1(v-r_t^A) \mathbb{P}(gap_{t-1}) \end{array}$$

- Demand of type 3 to Bank A should hence be:  $X_A^3(r_t^A,r_t^B)=\lambda_1(1-\mathbb{P})(rac{r_t^B-r_t^A}{2}+1)$
- Finally Total demand of type 2 and 3 to Bank B should be:

$$X_B(r_t^A, r_t^B) = X_B^2(r_t^B) + X_B^3(r_t^A, r_t^B) = \lambda_2(v - r_t^B) + \lambda_1(1 - \mathbb{P})(\frac{r_t^A - r_t^B}{2} + 1)$$
